

AI Audit Report

Declaration

I use AI tools for the following tasks.

OpenAI Codex assisted with requirement analysis, deliverable restructuring, checklist review, Playwright automation, runtime-result reconciliation, evidence indexing, defect documentation, cross-platform reporting, document generation, and final validation. AI output was reviewed against the assignment specification, the SUT source, live browser behavior, and generated artifacts. AI was not used to invent participant data, usability results, device evidence, GitHub Issues, or video links.

Interaction log

The conversation interface exposed the interaction date but not message-level clock times. The unavailable time component is stated explicitly rather than reconstructed.

AI-01 — Submission-structure review

Field	Record
Tool	OpenAI Codex
Date and time	2 August 2026; message-level time unavailable
Prompt	c�u tr�c th� m�c c�a docs\assignments\HW03\deliverables �� ph� h�p �� n�p b�i ch�a... theo y�u c�u ch�nh l� � "docs\assignments\HW03\specs\2026.HW03.GUI Usability_En.pdf"
AI output	Compared the proposed package with the PDF requirements and identified submission-only versus internal authoring artifacts.
Human review	Confirmed English submission documents, externalized utilities, and separate pilot/P1–P7 records.
Affected artifacts	deliverables/, workbench/

AI-02 — Professional restructuring

Field	Record
Tool	OpenAI Codex
Date and time	2 August 2026; message-level time unavailable
Prompt	v�y h�y fix sao cho c�u tr�c format l� th�t chu�n. n�i dung hi�n t�i c�a m�i file trong ph�n �� c�ng ph�i chu�n h�a c�u t� cho 1 report chuy�n nghi�p, kh�ng ph�i vi�t gi�n gi�n.
AI output	Reorganized the package, rewrote professional templates, separated workbench tools, and generated initial PDF/XLSX files.
Human review	Removed generated mock evidence and retained explicit evidence-integrity gates.
Affected artifacts	All HW03 submission templates and derived files

AI-03 — Runtime-completion request

Field	Record
Tool	OpenAI Codex
Date and time	2 August 2026; message-level time unavailable
Prompt	hãy tiến hành thực hiện test, và tiến hành kiểm tra nội dung có thể tiến (trả link video và screenshot của màn hình tiến thời)... hoàn thiện docs\assignments\HW03\deliverables tiến 90%... quy trình thực hiện cần liên tục test lại và review lại
AI output	Inspected the specification, source, database, existing checklist, browser availability, and evidence constraints; proposed a test-review-retest workflow.
Human review	Chose to keep Mobile items as Not Executed, defer real participant sessions, and let the student create GitHub Issues.
Affected artifacts	Execution plan and evidence policy

AI-04 — Screenshot-metadata clarification

Field	Record
Tool	OpenAI Codex
Date and time	2 August 2026; message-level time unavailable
Prompt	nh có overlay gồm 23127404@hcmus.edu.vn, browser, OS, URL, timestamp và test/checklist ID. này là gì, có cần thiết không hay chỉ cần ghi là chụp screen thời
AI output	Distinguished ordinary defect screenshots from the assignment's cross-platform identity/environment requirement. Removed unnecessary timestamp and checklist-ID overlays.
Human review	Approved simple bug captures and a compact identity/browser/OS/URL caption only for cross-platform images.
Affected artifacts	Evidence-capture rules and Chrome screenshots

AI-05 — Playwright execution and retest

Field	Record
Tool	OpenAI Codex with Playwright 1.57.0
Date and time	Final Google Chrome run: 2 August 2026, 08:31–08:32 ICT
Prompt	Implement the plan.
AI output	Built the internal runtime harness; executed Customer Web, Admin, and API checks; captured failed-item evidence; reset and repeated the run; produced 16 Passed, 15 Failed, and 14 Not Executed results.
Human review	Automation-only failures involving dialog handling, navigation timing, revenue parsing, and browser selection were corrected and rerun. The final run used installed Google Chrome rather than Playwright Chromium.
Affected artifacts	checklist/, bugs/evidence_images/, cross_platform/chrome_desktop/, workbench/automation/

AI-06 — Defect and report reconciliation

Field	Record
Tool	OpenAI Codex
Date and time	2 August 2026, after the final runtime execution
Prompt	Continuation of Implement the plan.

Field	Record
AI output	Reconciled the 45 checklist rows; documented 15 verified defects; isolated four unverified Mobile hypotheses; updated the main report, README, cross-platform status, and self-assessment.
Human review	Checked screenshot content and corrected the percentage-coupon interpretation. The contemporaneous removal of FR-23 in favor of an unnumbered Mobile pool was later found to conflict with the confirmed personal scope; that history is retained and corrected by AI-10 below.
Affected artifacts	All submission-facing Markdown, CSV, XLSX, and PDF artifacts

AI-07 — Firefox blocker diagnosis and rerun

Field	Record
Tool	OpenAI Codex with Playwright 1.57.0 and Firefox 144.0.2
Date and time	2 August 2026; message-level time unavailable
Prompt	Firefox Desktop: ch■a có ■nh vì Playwright không t■o■■■c page (browserContext.newPage b■ l■i), nên■■■c ghi là Blocked. C■n s■a l■i ■i, b■n c■n ch■y■■■c và l■y■■■c ■nh
AI output	Reproduced the failure with browser diagnostics, identified that the restricted sandbox blocked Firefox tab subprocesses, reran Firefox with the required process permission, completed the five-screen customer flow, and captured five authentic images.
Human review	Required the blocker to be resolved rather than accepted; the resulting Product List, Product Detail, Cart, Checkout, and Order History images were visually reviewed.
Affected artifacts	cross_platform/firefox_desktop/, cross-platform report, main report, audit, critique, and validation rules

AI-08 — Usability recording runbook and reference verification

Field	Record
Tool	OpenAI Codex with Google Chrome 151 and Playwright 1.57.0
Date and time	2 August 2026; message-level time unavailable
Prompt	k■ch b■n quay và thao tác c■ th■ ti■t l■ luôn. tôi c■n b■n hoàn thi■n m■i k■ch b■n quay và c■ thao tác và c■ k■t qu■ t■ng ph■n... tôi ch■ cung c■p video quay theo k■ch b■n thôi
AI output	Produced a complete moderated-session runbook, an explicit source/runtime-based reference path, standardized Pilot and P1–P7 checkpoint forms, and a recording-content checklist. Reran the selected Chrome flow to verify the technical reference results.
Human review	Selected a guided usability-test model and required expected/reference results while reserving participant behavior, timing, quotations, SUS responses, and recording links for genuine video evidence.
Affected artifacts	usability/, moderator guide, runtime reference verifier, main report, and validation rules

AI-09 — Evidence-gated SUS and findings workflow

Field	Record
Tool	OpenAI Codex
Date and time	2 August 2026; message-level time unavailable
Prompt	Implement the plan. after confirming that seven genuine participants will act and respond naturally
AI output	Added a canonical session-results dataset, SUS validation/calculation tooling, a traceable findings matrix, participant/timestamp evidence rules, and validation gates for completed sessions and response sets.

Field	Record
Human review	Confirmed that video will be supplied later and that participant actions, reactions, and SUS answers will be independently provided during the sessions.
Affected artifacts	Usability metrics, SUS workflow, findings synthesis, main report, audit, and submission validator

AI-10 — FR-23 scope-source correction

Field	Record
Tool	OpenAI Codex
Date and time	3 August 2026; message-level time unavailable
Prompt	Implement the approved plan to standardize FR-23 and the HW03 source of truth.
AI output	Restored FR-23 as Mobile Product Detail, replaced six out-of-scope Mobile checks, assigned all 14 pending Mobile rows to FR-23, separated report email from screenshot identity overlay, and strengthened generation and validation.
Human review	Confirmed personal scope supersedes the earlier unnumbered-pool interpretation. Existing desktop images remain unchanged, Web usability remains FR-07 → FR-10 → FR-11 with Product Detail as an FR-06 support step, and no Mobile status was promoted without runtime evidence.
Affected artifacts	Scope notes, checklist CSV/XLSX, submission reports, bug candidates, usability and cross-platform plans, generators, and validators

AI-11 — Source-derived Mobile checklist completion

Field	Record
Tool	OpenAI Codex
Date and time	3 August 2026; message-level time unavailable
Prompt	Complete the missing Mobile checklist information from source; screenshots will be supplied later.
AI output	Classified all 14 FR-23 checks from <code>frontend-mobile/App.js</code> as 8 Passed and 6 Failed, deduplicated the failures into five Mobile defects, and recorded source locations plus pending real-device evidence.
Human review	Explicitly selected Pass/Fail from source and requested the five Mobile defects be treated as official before screenshots are supplied. Each artifact retains the source-derived qualification so runtime evidence can supersede it later.
Affected artifacts	GUI checklist source/workbook, Mobile source-review evidence, defect report, README, main report, summaries, and validation rules

Human-review controls applied

- The original policy treated static source patterns only as hypotheses. AI-11 records the student's explicit exception for FR-23: source-derived Pass/Fail and official defects are allowed, but they must remain labeled and await real-device confirmation.
- Every counted defect was reproduced in two clean browser runs and mapped to a genuine screenshot.
- Playwright mobile emulation was not accepted as a physical/cloud-device platform.
- Firefox was counted only after the complete flow produced five visually reviewed, browser-identified screenshots.
- No participant name, contact, quotation, rating, duration, consent, or recording was generated.
- No GitHub Issue or video was claimed before an authentic externally accessible artifact existed.
- Summary counts were derived from the canonical checklist rather than entered independently.

Student attestation

Pending the student's final review and signature after participant, mobile, GitHub Issue, and video evidence are added.
