

HW06 — AI Audit Report

Student ID: 23127404

AI usage declaration: “I use AI tools for the following tasks.”

Recorded use in this workspace

The AI-assisted work for this package was performed with Codex (GPT-5) on 2026-08-23 (UTC+07). The work was deliberately split into specification review, equivalence/boundary design, state/security review, artifact generation, and live execution review. The resulting machine-readable test definitions preserve the generated cases, audit labels, source (AI Generated or Human Extended), and rationale in postman/data/*.json and the Excel workbook.

Activity	Input supplied to AI	Human review/output retained
Pool A design	FR-02, API spec, server.js	35 audited rows and 5 extensions; raw Newman case JSON
Pool B design	FR-08, cart/checkout API behavior	35 audited rows and 5 extensions; workflow raw JSON
Pool C design	FR-10/FR-18 state graph and SEC-03	35 audited rows and 5 extensions; workflow raw JSON
Evidence audit	Newman raw output and SQLite observations	execution manifest and six-root-cause bug register
Generator design	API specification and testing techniques	generator source, pseudocode, Mermaid design sources

Human-review decisions

1. Contract expectations and observed-SUT expectations are kept separate. A known-defect reproducer is marked BUG DETECTED ; it is never presented as a conforming contract pass.
2. Each Pool A case runs with an isolated fixture to prevent the lockout counter from contaminating later tests.
3. Pool B uses an actual login → cart → checkout → cart-query workflow; Pool C seeds a unique order precondition per state test.
4. Generated screenshots and invented execution metrics were removed. Only raw Newman output is used for numeric claims.

Student completion requirement

Before submission, the student must append any AI interaction not represented by the retained workspace artifacts with its exact tool/model, timestamp, unmodified prompt, and unmodified output. This report

intentionally does not invent conversations or timestamps that are not recoverable from the workspace.
