

HW06 CI/CD report

The GitHub Actions workflow runs the three Newman collections against the local backend on `ubuntu-latest` and uploads reporter output. Its implementation is version-controlled at `cicd/workflows/api-tests.yml`.

Verified GitHub Actions evidence

- All-pass evidence: commit `d07a9b1`, [GitHub Actions run](#), and authentic capture [ci-pass.png](#). The `Execute isolated evidence Newman suite` step completed successfully.
- Intentional-failure evidence: commit `aa32d91`, [GitHub Actions run](#), and authentic capture [ci-fail.png](#). It deliberately set `TC-LOGIN-01` to expect HTTP `999`; the API returned `200`, so the assertion failed as intended.
- The test data is restored to its correct `200` expectation in the local restoration commit. Push that commit, wait for its green workflow, and replace `ci-pass.png` with the resulting final-green capture before submission. The existing `d07a9b1` capture proves the workflow itself can pass, but predates this red run.
