

AI Audit Report

1. Declaration and controls

OpenAI Codex was used on 17 August 2026 for specification interpretation, JMeter plan review, raw-JTL analysis, evidence traceability, and report drafting. Local execution, screenshots, and external publication remained student-controlled. AI-generated text was reviewed against source code, JMX, screenshots, and raw JTL logs. No AI-generated performance result, screenshot, GitHub URL, or video URL is treated as evidence.

2. Material interaction record

The original chat transcript did not retain per-message clock times. Each interaction below therefore declares `time unavailable` rather than inventing a time; execution timestamps are retained independently in `supporting-materials/execution_manifest.md` and raw JTL files.

Local date / time	Tool	Student prompt or instruction	AI output	Human validation and outcome
17 Aug 2026; time unavailable - scope	OpenAI Codex	Analyse the specification and select endpoint groups/FR traceability using prior work.	Proposed login, product detail, cart, and checkout; classified auth/read/transactional groups.	Checked against backend routes and retained FR-02, FR-06, FR-07, FR-08 only.
17 Aug 2026; time unavailable - plan design	OpenAI Codex	Use JMeter and create equivalent Load, Stress, Spike plans with CSV data.	Generated JMX scaffolds with CSV variables, token extraction, assertions, and unique listener views.	Real preflight exposed a CSV/header mismatch, requiring execution review.
17 Aug 2026; time unavailable - correction	OpenAI Codex	Diagnose login failures in the preflight.	Identified the CSV data-file/header contract as the likely cause.	Header was removed; failed preflight retained separately; final scenarios ran successfully.
17 Aug 2026; time unavailable - evidence	OpenAI Codex	Explain and organise JMeter, Task Manager, dxdiag, lockout, and reset evidence.	Supplied evidence taxonomy and capture guidance.	EV-RUN, EV-HW, and EV-LOCKOUT artifacts were captured and verified on disk.
17 Aug 2026; time unavailable - lockout review	OpenAI Codex	Verify lockout runtime before calling it a bug.	Required a valid-login check after two invalid requests.	Fresh runtime sequence was 401, 401, 403 for valid password; the issue packet records the evidence.
17 Aug 2026; time unavailable - result analysis	OpenAI Codex	Summarise raw JTL files without inference.	Used the submitted skill script to calculate samples, errors, mean, p95, duration, and RPS.	Report values match raw-log summaries.
17 Aug 2026; time unavailable - reporting	OpenAI Codex	Prepare reports, critique, skill mirror, and continuous-testing proposal.	Drafted traceable Markdown and PDF rendering automation.	Main Report and AI Audit Report PDFs were rendered successfully.

3. AI misinterpretation hunt

AI-proposed claim or omission	Correct evidence	Why it was wrong or incomplete	Effect of review
A CSV header could coexist with explicit JMeter variable names.	Preflight JTL: 75 failed samples; final headerless CSV: successful runs.	JMeter used the first row as data when explicit variable names were supplied.	Preserved the failure for audit and excluded it from final metrics.
Lockout could be labelled a defect from source inspection alone.	Controlled runtime sequence: 401, 401, then valid-password 403.	Source explains a hypothesis but does not prove user-visible behavior.	Performed the valid-login check before writing the issue packet.
Task Manager screenshot can establish maximum capacity.	EV-HW-002 is a point-in-time monitor frame.	It has no continuous peak measurement.	Report avoids a fabricated capacity ceiling.

4. Usage conclusion

AI accelerated design and documentation but did not replace testing. JTL plus execution configuration is the acceptance source for performance claims; screenshots establish attribution, not missing metrics. The completed critique in `ai_critique.md` records the collaboration principle.
